

Elementary Math Addition: 1500 Tony Dow Elementary School

Addition is one of the most basic operations in mathematics. It is used to combine two or more numbers to get a total. Addition is essential for everyday life, from counting money to measuring ingredients for a recipe.

At 1500 Tony Dow Elementary School, we believe that all students can learn to add fluently and accurately. We provide a variety of instruction and practice opportunities to help our students master this important skill.

Addition is the process of combining two or more numbers to get a total. The numbers that are being combined are called addends, and the total is called the sum.

For example, the sum of 2 and 3 is 5. This can be written as the following addition problem:

$$2 + 3 = 5$$

Addition can be used to solve a variety of problems, such as:

- How many apples do I have if I have 2 apples in one hand and 3 apples in the other hand?
- How many cookies will I have if I bake 2 batches of cookies and each batch makes 12 cookies?
- How many students are in my class if there are 15 girls and 12 boys?

There are a variety of strategies that can be used to solve addition problems. Some of the most common strategies include:

- **Counting on:** This strategy involves starting with one of the addends and counting on the other addend. For example, to solve the problem $2 + 3$, you could start with 2 and count on 3: 2, 3, 4, 5.
- **Making a ten:** This strategy involves breaking down one of the addends into a number that is close to 10 and then adding the other addend. For example, to solve the problem $8 + 5$, you could break down 8 into 3 and 5 and then add 5 to each of those numbers: $3 + 5 = 8$, $5 + 5 = 10$, $8 + 10 = 18$.
- **Using a number line:** This strategy involves drawing a number line and then jumping from one addend to the other. For example, to solve the problem $2 + 3$, you could draw a number line and jump from 2 to 3: 2, 3, 4, 5.
- **Using mental math:** This strategy involves using mental shortcuts to solve addition problems. For example, to solve the problem $10 + 5$,

you could use the fact that $10 + 5 = 15$.

Addition is used in a variety of real-world applications, such as:

- **Counting money:** When you count money, you are adding up the value of the coins and bills.
- **Measuring ingredients:** When you measure ingredients for a recipe, you are adding up the amount of each ingredient.
- **Finding the total number of items:** When you find the total number of items in a group, you are adding up the number of items in each group.

Addition is an essential math skill that is used in a variety of everyday situations. At 1500 Tony Dow Elementary School, we are committed to providing our students with the instruction and practice they need to master this important skill.
